

COOPERATIVE ECONOMIC INSECT SURVEY REPORT
Glenn A. Salsbury, Survey Entomologist

Report 5, Volume 57
April 25, 2009

ARMYWORM: 132 moths were caught on the night of 22 April in Crawford County. Growers need to be alert for this pest as wheat begins heading and especially as the crop begins to mature. The moths prefer to lay their eggs in dense or lodged wheat. Larvae not only eat the foliage but may clip the heads as well.

WHEATHEAD ARMYWORM: This pest most often appears as the wheat is maturing and often comes as a surprise because it appears late. The larvae feed on the developing grain.

BLACK CUTWORM: Five moths were caught along with the armyworms.

BARK BEETLES: Various species continue to be caught in significant numbers. Of particular note are the GRANULATE AMBROSIA BEETLE and the SHOT HOLE BORER.

YELLOW SCALE: A light infestation was recently found on lemon tree.

EUONYMUS SCALE: A moderate infestation was found on euonymus at a retail outlet.
